

Full-Stack Robotics: Lessons from Building Across the Robotics Stack

Suveen Ellawela
Founding Engineer @ Cortex AI

autonomous, 2x speed

teleop, 2x speed

autonomous, 2x speed

autonomous, 4x speed

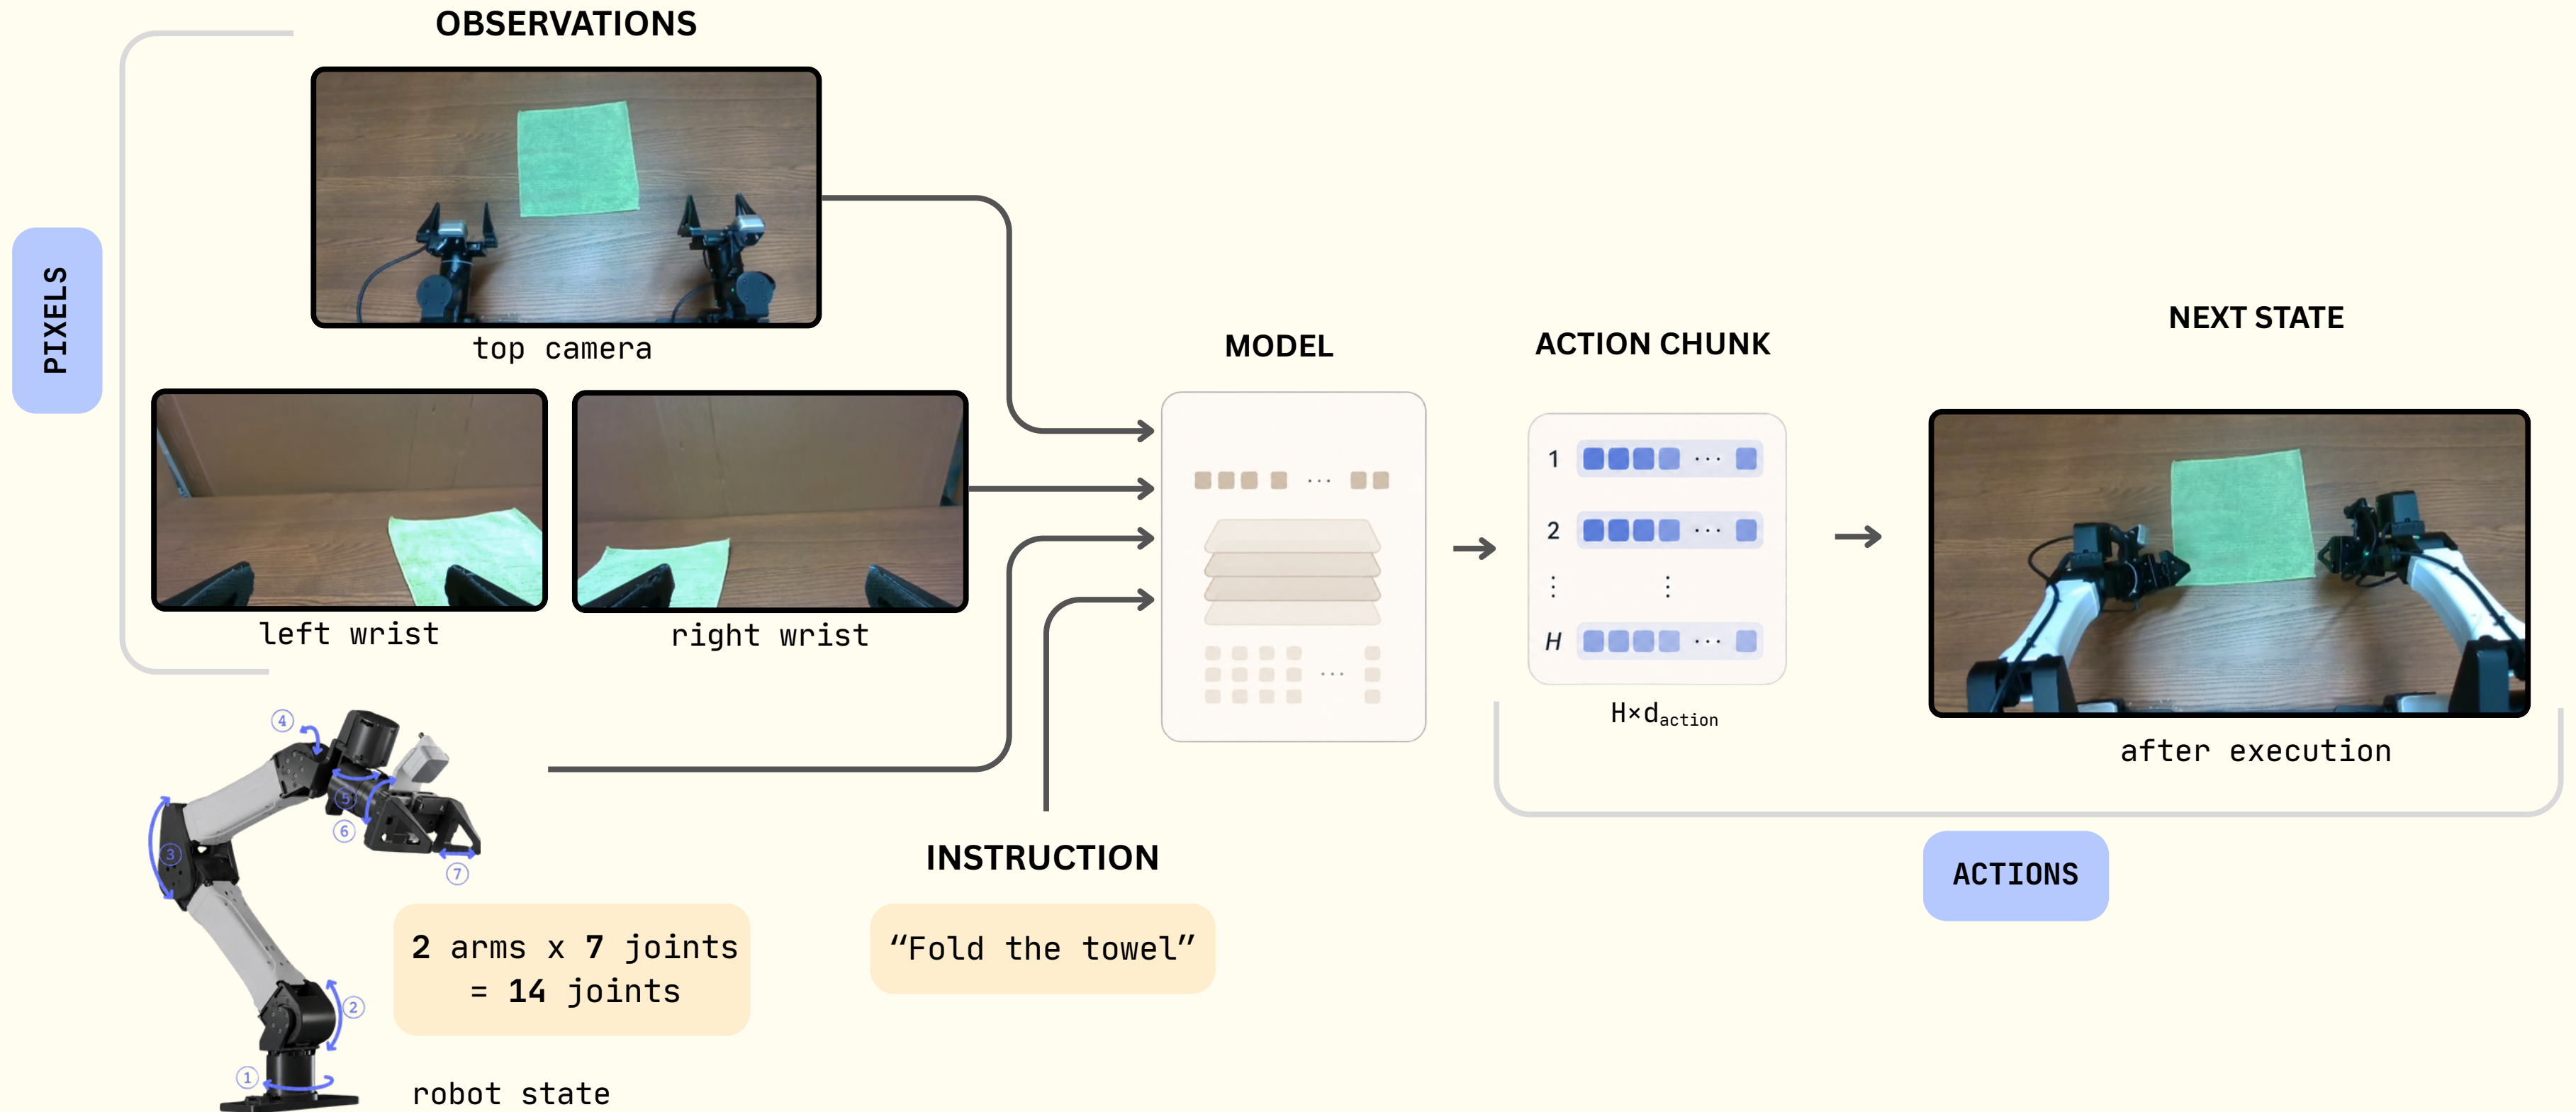

autonomous, 4x speed

**How did these
robots get so
smart?**

Smart enough to even pour
the last drop of milk
into the cup?

From pixels to actions

THE ROBOTICS STACK

Robotics is also a data and
operations problem

To train MolmoAct 2, we created the MolmoAct 2-Bimanual YAM dataset, a 700-hour collection of robot demonstrations involving two machine arms working together, covering coordinated tasks such as folding a towel, scanning groceries, charging a smartphone, and table bussing. MolmoAct 2-Bimanual YAM dataset is the largest open-source bimanual robotics dataset ever released, and contains over 30x the robot data used for MolmoAct. We curated MolmoAct 2-Bimanual YAM dataset with support from [Cortex AI](#).

720h MolmoAct2 Bimanual YAM dataset

The largest open bimanual
dataset to date

<https://huggingface.co/collections/allenai/molmoact2-bimanualyam-dataset>

Teleoperating Robots is Hard!

Human intuition does not transfer
perfectly to a new body.

High-quality data starts before recording

1

Plan the task

Define task steps and success conditions

2

Practice the Motion

Make the behavior smooth and repeatable

3

Collect Consistently

Reduce variation across episodes and operators

Small workflow changes compound

FRICTION

Waiting for every
episode to encode

Encoding blocks the
setup

WHAT WE CHANGED

Encode after the
session

Disconnect hardware
and start new session

RESULT

DATA RECORDING

ENCODING/UPLOADING

Completely decoupled!

Breadth matters more than ever
in Robotics today

OPERATING ACROSS THE STACK

Breaking Grippers

```
self.gripper.set_max_force(x)
```

Hardware solution for a
Software problem!

Moving Cameras

**Software solution for a
Hardware problem!**

Evaluation is still one of
robotics' biggest bottlenecks

Evaluating Robots

SIMULATION

VS

REAL-WORLD

Simulations are useful but diverse real-world environments capture true reliability and edge cases.

To validate MolmoAct 2 beyond our own lab evaluations, we retained Cortex AI, a robotics data and evaluation company, to conduct a third-party benchmark of MolmoAct 2's real-world fine-tuning performance. Cortex AI evaluated five robotics policies including MolmoAct 2 across multiple bimanual tasks using a systematic many-trial setup.

MolmoAct 2 achieved the highest average score at 0.51, ahead of OpenVLA-OFT at 0.36, $\pi 0.5$ at 0.32, Cosmos Policy at 0.16, and X-VLA at 0.05. It also had the strongest task-level showing, ranking first on 7 of 8 tasks, including returning a test tube to a tray, storing candy, putting tools away, putting toys away, storing cups, preparing the pipette tip, and making popcorn.

Cortex AI YAM bimanual benchmark results

Task scores across Cortex AI's 8-task YAM bimanual real-world evaluation, rounded to two decimal places. Best score in each row is bold and underlined.

TASK	$\pi 0.5$	COSMOS POLICY	X-VLA	OPENVLA-OFT	MOLMOACT 2
Cups stacking	0.62	<u>0.65</u>	0.06	0.61	<u>0.54</u>
Put the test tube back	0.17	0.11	0.00	0.42	<u>0.67</u>
Store candy	0.26	0.00	0.04	0.27	<u>0.41</u>
Put tools away	0.02	0.00	0.03	0.05	<u>0.14</u>
Put toys away	0.26	0.07	0.03	0.02	<u>0.32</u>
Store cups	0.86	0.00	0.08	0.96	<u>1.00</u>
Prepare the pipette tip	0.28	0.32	0.12	0.29	<u>0.33</u>
Make popcorn with LinearBot (LinearBot)	0.12	0.13	0.05	0.24	<u>0.64</u>
Average	0.32	0.16	0.05	0.36	<u>0.51</u>

Cortex AI YAM Bimanual Benchmark

1000s of real world evaluation rollouts across 5 policies

Every rollout
has a
reset cost

When a robot fails,
where did it actually
fail?

setup • data • training
robot execution • evaluation

Robot failures can come from many layers

DATA

- inconsistent demos
- task strategy mismatch

TRAINING

- LoRA vs Full fine-tuning

SETUP

- model loading issue
- wrong action chunk size

EVALUATION

- object placement

and more....

Safety is part of the stack

Every stage has a human safety surface.

DATA COLLECTION

Leader arm failure → operator suddenly bears the load

EVALUATION

Evaluation failures → physical hazards
Stale action queues → sudden arm movements

and more....

Running AI-written code on Robots

<https://www.anthropic.com/research/project-fetch-robot-dog>

Run it like it can fail

1 Offline checks

type checks, unit tests, manually check if business logic is correct

2 Replay/ Simulation

test on logs or in simulation when possible

3 Supervised robot runs

slow speed, move a single joint first
operator + E-stop

A terminal window titled 'cortexai@cortexai-OptiPlex-7080: ~/lerobot' with several tabs. The active tab shows log output from 't_client.py:609' at timestamps 15:42:35. The logs show joint positions and gripper status for three consecutive time steps (t=607, 608, 609). The data is as follows:

Time	left_joint_0.pos	left_joint_1.pos	left_joint_2.pos	left_joint_3.pos	left_joint_4.pos	left_joint_5.pos	left_gripper.pos	right_joint_0.pos	right_joint_1.pos	right_joint_2.pos	right_joint_3.pos	right_joint_4.pos	right_joint_5.pos	right_gripper.pos	base.y.vel
607	+0.0086	+0.0311	+0.0184	-0.1107	-0.0114	+0.0040	+1.0000	-0.4935	+0.8322	+1.0704	-0.7030	-0.5611	-0.2454	+0.0694	-0.0003
608	+0.0093	+0.0306	+0.0230	-0.1101	-0.0087	+0.0034	+1.0000	-0.4952	+0.8318	+1.0735	-0.7121	-0.5608	-0.2439	+0.0671	-0.0009
609	+0.0088	+0.0301	+0.0202	-0.1072	-0.0096	+0.0042	+1.0000	-0.4964	+0.8288	+1.0720	-0.7030	-0.5588	-0.2408	+0.0677	-0.0018

Biggest takeaway

The faster you can move
across the stack, the
faster you can solve
problems.

data

software

hardware

models

evaluation

operations

We're hiring people who like working
across the robotics stack.
